

New hope for herniated disc sufferers and those with failed back syndrome.

Dr. Nelson Mañe a board certified chiropractic orthopedist and neurologist is offering High Power Laser Therapy as an alternative treatment modality to those with a disc herniation who are trying to avoid surgery or have already had an unsuccessful surgery and Failed Back Syndrome. Laser therapy has been shown to increase bone and cartilage repair, reduce scar tissue, reduce inflammation, increase circulation, increase angiogenesis (new blood vessels formed), and regenerates nerve fibers as well as increase ATP production (energy). The unique aspect of the High Power Laser Therapy is its ability to penetrate deep enough to treat the target tissue (disc and spinal nerves). The procedure is non invasive and pain free. No preparation is needed for the procedure. The patient drives to the office to get their treatments and drives home. Our typical patient has failed treatments with medication, standard physical therapy and epidurals steroid injections. The patients are usually trying to avoid surgery or have had a failed surgical procedure. Dr. Mañe stated “we are seeing the worst x-rays and MRI’s and still having good success.” Dr. Mañe’s office has performed over 5000 High Power Laser treatments and is one of the most experienced High Power Laser centers in the country.
